Edits ...

When repeatedly calling the sampling op on a large circuit, I find that the used system memory keeps jumping on each call. For example, in the following script, the used system memory jumps by ~ 2 GB each time `sample_op` is called:

```
import cirq
import tensorflow as tf
import tensorflow_quantum as tfq
import time

num_qubits = 28
num_runs = 10
sleep_time = 5.0
repetitions = 1000
qubits = cirq.GridQubit.rect(1, num_qubits)
circuit = cirq.Circuit([cirq.X(q) for q in qubits])
sample_op = tfq.get_sampling_op()
for r in range(num_runs):
    result = sample_op(tfq.convert_to_tensor([circuit]), [], [], [repetitions])
    time.sleep(sleep_time)
    print("Finished run {}".format(r))
```

This used today-installed `tfq-nightly` and `tensorflow==2.3.0`.
