This issue is the result of some investigation following this bug report: [#128](#)

Steps to reproduce the problem

```
from qiskit.primitives import BackendSampler

from qiskit_algorithms.minimum_eigensolvers import QAOA
from qiskit_algorithms.optimizers import COBYLA
from qiskit_optimization.algorithms import MinimumEigenOptimizer
from qiskit_optimization.problems import QuadraticProgram
from qiskit_optimization.translators import from_docplex_mp

from qiskit_braket_provider import AWSBraketProvider

from docplex.mp.model import Model

mdl = Model("docplex model")
x0 = mdl.binary_var("x0")
x1 = mdl.binary_var("x1")
x2 = mdl.binary_var("x2")

mdl.minimize(-30*x0**2 + 14*x0*x1 + 14*x0*x2 - 35*x1**2 + 14*x1*x2 - 29*x2**2)

mod = from_docplex_mp(mdl)

sampler = BackendSampler(
    # backend=AWSBraketProvider().get_backend("Aspen-M-3"),
    backend=BraketLocalBackend(),
    skip_transpilation=False,
    options={"shots": 100}
)

qaoa = QAOA(sampler=sampler, optimizer=COBYLA())
qaoa_solver = MinimumEigenOptimizer(qaoa)
result = qaoa_solver.solve(mod)
```

What is the current behavior?

`ValueError: Observable's qubit count 1 and the size of the target qubit set QubitSet([Qubit(1), Qubit(0)]) must be equal`

What is the expected behavior?

Success

Proposed solution

I believe that the existing method to convert Qiskit measurements to Braket result types is misusing the Braket API. This might fix the problem:

<https://github.com/qiskit-community/qiskit-braket-provider/compare/main...laurencap:qiskit-braket-provider:bugfix/convert-qiskit-to-braket-measurements?expand=1>

The fix is good and the bug is pretty bad. I shamelessly borrowed the fix and went further by renaming most of the variables in the function. Please have a look at [#135](#).

Summary

Measure instructions were wrongly translated. We now construct a 1-qubit sampling instruction.

Details and comments

We were translating a 1-qubit measure instruction into a 2-qubit ZZ observable sampling instruction (using the classical register index for the second qubit). This PR uses the right instruction and renames most of the variables in the function to be clearer.

Fixes #132.

Probably orthogonal to this change, but it looks like the buggy code was originally added to fix an issue when a circuit has multiple registers: #51. Do you know if that scenario works now?
