Edits · ...

Rotosolve currently contains code that isn't supported in `disable_eager_execution` mode:

```
quantum/tensorflow_quantum/python/optimizers/rotoresolve_minimizer.py
Line 236 in f9a815a
236     return (state.num_iterations < max_iterations) \
```

To reproduce:

```
# %%
import tensorflow_quantum as tfq
import tensorflow as tf
import numpy as np

# %%
tf.compat.v1.disable_eager_execution()

# %%
n = 10 # Number of sinusoids
coefficient = tf.random.uniform(shape=[n])
min_value = -tf.math.reduce_sum(tf.abs(coefficient))
func = lambda x: tf.math.reduce_sum(tf.sin(x) * coefficient)
# Optimize the function with rotoresolve, start with random parameters
result = tfq.optimizers.rotoresolve_minimize(func, np.random.random(n))
print(result.converged)
print(result.objective_value)
```

Gives error message:

```
Traceback (most recent call last):

This appears to be an issue with using the v1 api (which was around and deprecated before TFQ came out and likely a will not fix on our end). If you would like to disable running functions eagerly you can do something like:

```
tf.config.run_functions_eagerly(False)
```

Which still appears to work with this snippet.
