Information

- Qiskit Optimization version: 0.2.2
- Qiskit version: 0.29.0
- Python version: 3.8.6
- Operating system: Linux

What is the current behavior?

RecursiveMinimumEigenOptimizer / pauli_trotter_evolution throws following error:

```
-----
ValueError                                Traceback (most recent call last)

ValueError: max() arg is an empty sequence

```

Steps to reproduce the problem

```

import networkx as nx
import numpy as np
from qiskit.algorithms.optimizers import SPSA
from qiskit.utils import QuantumInstance
from qiskit_optimization.algorithms import MinimumEigenOptimizer, RecursiveMinimumEigenOptimizer

from qiskit.algorithms import QAOA
from qiskit_optimization.applications import Maxcut
from qiskit import Aer
from qiskit_optimization.problems.quadratic_program import QuadraticProgram
from qiskit_optimization.converters import QuadraticProgramToQubo

# create graph
n = 4
graph = nx.Graph()
graph.add_nodes_from(np.arange(0, n, 1))
elist = [(0, 1, 1), (0, 3, 1), (0, 2, 1), (1, 2, 1), (1, 3, 1), (2, 3, 1)]
graph.add_weighted_edges_from(elist)

# create Maxcut
max_cut = Maxcut(graph)
max_cut_problem = max_cut.to_quadratic_program()
conv_toQubo = QuadraticProgramToQubo()
max_cut_qubo = conv_toQubo.convert(max_cut_problem)

# create qaoa
reps = 3
initial_point = [-0.54695145, 3.42723337] * reps
quantum_instance = QuantumInstance(backend=Aer.get_backend('qasm_simulator'), shots=1024)
qaoa = QAOA(optimizer=SPSA(maxiter=0), reps=reps, initial_point=initial_point, quantum_instance=quantum_instance)

# execute recursive qaoa
RecursiveMinimumEigenOptimizer(MinimumEigenOptimizer(qaoa)).solve(max_cut_qubo)

```

What is the expected behavior?

The program runs without errors.

Suggested solutions

None.

It seems to be a sporadic error that does not always occur.

```
reps = 3
initial_point = [-0.54695145, 3.42723337] * reps
quantum_instance = QuantumInstance(backend=Aer.get_backend('qasm_simulator'), shots=1024)
qaoa = QAOA(optimizer=SPSA(maxiter=0), reps=reps, initial_point=initial_point, quantum_instance=quantum_instance)

# execute recursive qaoa
RecursiveMinimumEigenOptimizer(MinimumEigenOptimizer(qaoa)).solve(max_cut_qubo)
```

What is the expected behavior?

The program runs without errors.

Suggested solutions

None.

It seems to be a sporadic error that does not always occur.

I have tested the function using the same scheme with several graphs and I noticed that the error happens mainly with unweighted graphs.

`RecursiveMinimumEigenOptimizer` iteratively solves the problem by fixing some variables. The subproblems have smaller number of variables than that of the original problem. So, setting `initial_point` explicitly does not work because the size of `initial_point` can be larger than that of subproblems.

This PR fixes the case where a subproblem is an identity. [Qiskit/qiskit#7225](https://github.com/Qiskit/qiskit/pull/7225)
