Aer Estimator wrongly reads global phase #1795

[New issue](#)[Closed](#)

A-ta-v opened on Apr 26, 2023

...

Informations

- Qiskit Aer version: 0.12.0
- Python version: 3.10
- Operating system: Mac OS Ventura, Intel

What is the current behavior?

Aer Estimator crashes while running simulation.

Steps to reproduce the problem

Script below

What is the expected behavior?

I create a parameter placeholder at the beginning.
After prepending the circuit with ZFeatureMap and several compositions the final circuit obtains a non-zero global phase represented as a linear combination of placeholder's entries. I do *NOT* change the global phase myself, rather this is the outcome of aforementioned operations.
At the time of evaluation, the linear combination of placeholder's entries cannot not be cast to a float value causing an exception.

In the simple example below, I reproduced the behaviour by explicitly expressing the global phase as a sum of two placeholder entries.
Note, the default estimator works without a problem.

Suggested solutions

Checking of global phase before evaluation is needed.

Script reproducing the issue:

```
import time
import numpy as np
from qiskit import QuantumCircuit
from qiskit.circuit import ParameterVector
from qiskit.primitives import Estimator as BackendEstimator
from qiskit.providers.fake_provider import FakeKolkataV2
from qiskit.quantum_info import SparsePauliOp
from qiskit.utils import algorithm_globals
from qiskit_aer.primitives import Estimator as AerEstimator

def report():
    num_qubits = 10
    algorithm_globals.random_seed = 1234567
    np.random.seed(algorithm_globals.random_seed)

    # Create a circuit with parameter placeholder.
    params = ParameterVector(name="r", length=num_qubits - 1)
    qc = QuantumCircuit(num_qubits)
    for i in range(num_qubits - 1):
        qc.cx(i, i + 1)
        qc.rz(params[i], i)
    qc.global_phase = params[0] + params[1] # <<<<< MAKES THE PROBLEM

    params = np.random.rand(len(params))
    observable = SparsePauliOp.from_list([("Z" * qc.num_qubits, 1)])
```

ikkoham on May 2, 2023

Collaborator ...

Thank you for your report. This is a bug. Latest Aer cannot handle parameters in the global phase.

Summary

Though `ParameterExpression` can be set to `QuantumCircuit.global_phase`, Aer does not bind parameter values to it in simulation phase. This PR fixes this problem by resolving values of `global_phase` with specified `parameter_binds` in `AerSimulator.run` as well as for parameter values of gates.

Details and comments

This PR resolves [#1798](#), [#1781](#), and [#1795](#).

Support parameterized global phase

```

doichanj on May 18, 2023

Collaborator

I think it is not necessary to change `uint_t` to `int_t` to point this params are global phases, and use pre-defined value such as `GLOBAL_PHASE_POS` instead of using `-1`
