[BUG] First-order derivative with unshifted shift term in gradient recipe breaks param_shift #2833

[New issue](#)[Closed](#)[#2834](#)

dwierichs opened on Jul 19, 2022

...

Expected behavior

The gradient is computed correctly by `qml.gradient.param_shift` even when using an operation that contains an unshifted term in its first-order gradient rule, provided via `gradient_recipe`.

Actual behavior

A custom operation with the gradient recipe containing the term `[coeff, 1, 0]` breaks `param_shift` (`qnode1` in the code below) unless all operations require such a term (`qnode2` in the code below)

Additional information

This is due to wrong handling of `unshifted_coeffs` in `expval_param_shift`. Will fix.

Source code

```
dev = qml.device('default.mixed', wires=2)

class OP(qml.operation.Operation):
    num_wires = 1
    ndim_params = (0,)
    num_params = 1
    grad_method = "A"
    #the first term corresponds to the unshifted tape
    grad_recipe = ([[1, 1, 0], [-1, 0, 1]],)

    @staticmethod
    def compute_decomposition(x, wires):
        return [qml.RX(x, wires=wires)]

@qml.qnode(dev)
def qnode1(params):
    OP(params[0], wires=0)
    qml.RY(0.1, wires=0)
    qml.RZ(params[1], wires=0)
    return qml.expval(qml.PauliZ(0))

@qml.qnode(dev)
def qnode2(params):
    OP(params[0], wires=0)
    OP(params[1], wires=0)
    return qml.expval(qml.PauliZ(0))

params = np.array([0.2, 0.3])
qnode(params)
qml.gradients.param_shift(qnode)(params)
```

This PR restructures param_shift . In particular, it introduces additional helper methods, trying to modularize the main for loop of expval_param_shift .
In addition, this restructuring fixed #2833, as this bug was caused by flawed bookkeeping of unshifted coefficients (it worked for second order derivatives because usually then all operations require the unshifted tape.
Related issue: #2833
